## **EXECUTIVE SUMMARY**

Penn State's Department of Plant Pathology & Environmental Microbiology potato research program can be categorized into four areas: 1) variety breeding and evaluation, 2) breeding for disease resistance (focused on early blight, late blight and common scab), 3) biology and genetic variability of potato pathogens (focused on early and late blight and common scab), and 4) integrated pest management of potatoes. Many of these projects are long term and only results of 2022 field trials are presented here.

### **1. Variety Breeding and Evaluation**

Potato variety evaluation trials were conducted at four locations in PA. At the Rock Springs location the variety trial included 114 round whites with a few yellow flesh, 26 red-skinned (a few purple skinned) and 33 russet or long white types. An early season variety trial of 25 varieties was conducted at Rock Springs. An early season papa criolla (small yellow potato) variety trial of 8 varieties was conducted at Rock Springs. The Lehigh County location and Erie County location had 35 and 37 varieties, respectively. Snack Food Association trial of 10 chipping varieties was conducted in Franklin County. Breeding lines were contributed by USDA-ARS, Maine, New York, North Carolina, Michigan, Idaho, Colorado, Wisconsin and a few other sources. See **Pennsylvania Regional Potato Germplasm Evaluation Program, 2022 on pages 1-2, data tables from different locations on pages 3-33, trial management information on page 34, descriptions of promising varieties for Pennsylvania on pages 35-38, supplemental processing (chipping and French Fry) report on pages 42-43, and processing data tables from different locations on pages 44-51.**

### **2. Breeding for Disease Resistance**

In three separate field trials, 38 potato varieties and advanced breeding lines were evaluated for resistance to common scab, late blight and early blight, respectively at Rock Springs.

In common scab screening trial, cultivars Russet Burbank and Shepody were included as a tolerant and a susceptible check for common scab, respectively. Numerically, although not statistically, Dark Red Norland , AF5819-2, NDAF113484B-1, Russet Norkotah, AF6338-6, NDAF113476CB-3, AF5762-8, Superior, AF5735-8 and MSAFB609-12 had a lower disease severity score and disease incidence than Russet Burbank and were considered as tolerant to common scab. See **Evaluation of potato cultivars and breeding lines for resistance to common scab on page 39.**

In late blight screening trial, the most susceptible plots reached 100% disease severity by the end of the season. Cultivar Kennebec was a moderately resistant check. Based on AUDPC values, AF5406-7, MSAFB609-12, AF6075-8, AF5735-8, NY165, AF5750-16, AF5707-1, AF6194-4, AF6338-6 and Lakeview Russet were significantly more resistant

than cv. Kennebec. See **Evaluation of potato cultivars and breeding lines for resistance to late blight on page 40.**

In early blight screening trial, disease pressure from early blight was high and the most susceptible plots reached 100% disease severity by the end of the season. Cultivars Kennebec and Russet Burbank were included as moderately resistant checks and Dark Red Norland was included as a susceptible check. Twelve cultivars/lines (AF5406-7, AF6338-6, Katahdin, AF5762-8, AF5071-2, Lakeview Russet, AF5521-1, AF5707-1, AF5750-16, Snowden, Shepody and AF6075-8) were characterized as moderately resistant because their AUDPC values were not significantly different from the moderately resistant check Russet Burbank and lower than the moderately resistant check Kennebec. See **Evaluation of potato cultivars and breeding lines for resistance to early blight on page 41.**

## **Progress Report---December 2022**

### **Pennsylvania Regional Potato Germplasm Evaluation Program, 2022**

**Xinshun Qu and Michael Peck**

**Department of Plant Pathology and Environmental Microbiology**

**The Pennsylvania State University**

The objective of this project is to find new potato varieties and advanced breeding lines that have adaptation to Pennsylvania potato growing regions, and have qualities that are suitable for either processing or tablestock use. We cooperate with the project leaders of several other potato breeding programs from the Northeast US and a few programs from the Midwest US and Canada by evaluating their potato germplasm. Data from this project helps breeders determine which lines to focus on for potential release as new varieties and also allows you to focus on very specific lines that may be released in the near future.

Replicated and non-replicated variety evaluation plots were established at the following locations: Lehigh Co. (Tables 1- 2), Erie Co. (Tables 3-4) and Rock Springs, Centre Co. (Tables 5-12). The Lehigh location and Erie location had 35 and 37 varieties/lines in non-replicated trial, respectively. At the Rock Springs location the trials included 55 round whites with a few yellow flesh, 13 red-skinned (a few purple skinned) and 20 russet or long white types in replicated plots, and an additional 59 whites, 13 red-skinned and 13 russet or long white types planted in non-replicated observational plots. At Lehigh and Erie locations, the seed spacing was 9-inch within a 20-ft plot except for the russets that were at 12-inch. The weather was hot and dry during growing season at Lehigh location. At Rock Springs location, the seed spacing was 9-inch within a 10-ft plot except for the russets and some whites that were at 12-inch. An early variety trial of 25 varieties was conducted at Rock Springs, Centre Co. (Tables 13-14). An early season papa criolla (small yellow potato) variety trial of 8 varieties was conducted at Rock Springs, Centre Co. (Tables 15). Snack Food Association trial of 10 chipping varieties was conducted by PA co-op at Bryan Bender's Farm in Chambersburg (Tables 16-17). Management information for each site is provided in Table 18. We assessed yield, tuber size, overall appearance, internal defects and external defects, skin color, texture, tuber shape, specific gravity, French Fry and chip qualities.

To interpret this data, one needs to know the yields for the check cultivars such as Atlantic, Snowden, Katahdin, Chieftain, Dark Red Norland, Russet Norkotah or Superior on your farm. Then compare the typical yield for this year on your farm to the data presented here. The yields tend to be inflated from these small plots but the ranking of the yields over the cultivars/lines usually is fairly consistent. Also the same method can be used to compare specific gravity and some of the other parameters. There are a few lines that will be very specific to certain environments so make the comparison to the location that best matches your own or use the Rock Springs location as a fairly typical area for most of PA.

### **Results:**

#### **Lehigh County trial:**

At the Lehigh location the following lines had marketable yield higher than Atlantic: Chieftain, AF5280-5, Abbot and Agate.

**Erie County trial:**

At the Erie location, Snowden, Chieftain, AF5280-5, Agate, NY163, NY165, NY168, NY177, MSAFB609-12, SP327, Bridget and Donata had marketable yield higher than Atlantic.

**Round white planted 9-inch apart in Rock Springs:**

Based on data of replicated trials at Rock Springs, there were 5 round white clones with marketable yields significantly higher than Atlantic: AF5819-2, AF6165-9, AF6555-2, WAF14096-5, and NY168; there were another 11 round white clones with marketable yields higher than Atlantic. In non-replicated trial, there were 22 round white clones with marketable yields higher than Atlantic.

**Red-skinned planted 9-inch apart in Rock Springs:**

Based on data of replicated trials at Rock Springs, A08122-9RY and NC981-01 had marketable yields significantly higher than Chieftain; there were another 7 red-skinned or purple-skinned clones with marketable yields higher than Chieftain: Dark Red Norland, CO15205-4R, CO15211-1R, AAF11546-3, AAF11611-2, BNC839-5 and A11582-1R. In non-replicated trial, 12 clones had marketable yields higher than Chieftain.

**Russet-skinned or white planted 12-inch apart in Rock Springs:**

Based on data of replicated trials at Rock Springs, Russet Burbank, Lakeview Russet, AAF10596-1, AF5071-2, AF5406-7, AF5707-1, AF5750-16, AF6075-8, NDAF113476CB-3 and AFA5661-8 had marketable yields higher than Russet Norkotah. In non-replicated trial, AF6377-13, AF6855-4, AAF16069-2 had marketable yields higher than Russet Norkotah.

**Early season variety trial in Rock Springs:**

Based on data of replicated trials at Rock Springs, Agate, Paroli, NDA8512C-1R, W8893-1R, BNC917-2, Atlantic, B2869-29, NY165, MegaChip, Mainstee, Mackinaw, SP327, Russet Norkotah and Donata had marketable yields significantly higher than Superior.

**The Pennsylvania Potato Research Program, the Pennsylvania Department of Agriculture and USDA funded this research in conjunction with donations. This research is the result of cooperation of growers, industry and PSU staff. The growers hosting the plots provided contributions (land, fertilizer, pesticides, time, etc.). University of Maine, Cornell University, USDA Beltsville, USDA Idaho, Colorado State University, Michigan State University, North Carolina State University, University of Wisconsin potato breeding programs and Solanum International, Parkland Seed, Sterman Masser Inc. provided seed. Special thanks to Bob Leiby who made sure this project was completed.**

Table 1. Total yield, greater than 1 7/8" yield, percent of standard, size distribution, percent pick outs and specific gravity for potato evaluation trial in Timothy and Deborah Geiger's Farm, Lehigh County, 2022

<sup>1</sup>Tuber Characteristics: TA = tuber appearance: 1 = very poor, 5=fair, 9=excellent.

C = skin color: 1 = purple, 2 = red, 3 = pink, 4 = dark brown, 5 = brown, 6 = tan, 7 = buff, 8 = white, 9 = cream.

TX = skin texture: 1 = partial russet, 2 = heavy russet, 3 = mod. russet, 4 = light russet, 5 = netted, 6 = slight net, 7 = mod. smooth, 8 = smooth, 9 = very smooth.

Sh = tuber shape: 1 = round, 2 = mostly round, 3 = round-oblong, 4 = mostly oblong, 5 = oblong, 6 = oblong-long, 7 = mostly long, 8 = long, 9 = cylindical.

TED = tuber eye depth: 1 = very deep, 5 = medium, 9 = very shallow. TCS = tuber cross section: 1 = very flat, 5 = intermediate, 9 = very round.

<sup>2</sup>Internal Defects: HH = hollow heart, IB = internal browning. Percent of total number observed out of 10 tubers. 0 = not observed.

<sup>1</sup>Yield Total = all yield including pickouts. Yield >1 7/8" = categories 2, 3, 4 and 5 excluding pickouts.

<sup>2</sup>Percentage of the standard, Atlantic, for >1 7/8" yield.

<sup>3</sup>Percentage of total yield according to size class. 1=<1.875 in., 2=1.875-2.5 in., 3=2.5-3.25 in., 4=3.25-4.0 in., 5=>4.0 in.

<sup>4</sup>Percentage of total that are pickouts.

Planted 9-in. apart with 13 seed pieces per 10-ft plot. Yellow flesh varieties are indicated with <sup>y</sup>.

Replicated trials are the average of 3 replicates and the rest are non-replicated.

LSD indicates least significant difference ( $P = 0.05$ ), calculated for replicated varieties.

<sup>1</sup>Tuber Characteristics: TA = tuber appearance: 1 = very poor, 5= fair, 9 = excellent.

C = skin color: 1 = purple, 2 = red, 3 = pink, 4 = dark brown, 5 = brown, 6 = tan, 7 = buff, 8 = white, 9 = cream.

TX = skin texture: 1 = partial russet, 2 = heavy russet, 3 = mod. russet, 4 = light russet, 5 = netted, 6 = slight net, 7 = mod. smooth, 8 = smooth, 9 = very smooth.

Sh = tuber shape: 1 = round, 2 = mostly round, 3 = round-oblong, 4 = mostly oblong, 5 = oblong 6 = oblong-long 7 = mostly long 8 = long, 9 = cylindrical.

TED = tuber eye depth: 1 = very deep, 5 = medium, 9 = very shallow. TCS = tuber cross section: 1 = very flat, 5 = intermediate, 9 = very round.

<sup>2</sup>Internal Defects: HH = hollow heart, IB = internal browning. Percent of total number observed out of 12 tubers for replicated trials and total number out of 4 for non replicated trials (marked with \*). 0 = not observed.

Table 11. Total yield, greater than 1 7/8", percent of standard, size distribution, percent pickouts, specific gravity and merit score for NE1731<sup>1</sup> potato evaluation trial in Plant Pathology Farm, Rock Springs, 2022

LSD	104	79	12		4	16	16	17	6	13					

<sup>1</sup>NE1731 is an integrated, seven-state (Florida, Maine, North Carolina, New York, Ohio, Pennsylvania, and Virginia) potato breeding and variety development project for the eastern U.S.

<sup>2</sup>Yield Total = all yield including pickouts. Yield >1 7/8" = categories 2, 3, 4 and 5 excluding pickouts.

<sup>3</sup>Percentage of the standard, Atlantic, for >1 7/8" yield. Yield >1 7/8" = categories 2, 3, 4 and 5 excluding pickouts.

<sup>4</sup>Percentage of total yield according to size class. 1=<1.875 in., 2=1.875-2.5 in., 3=2.5-3.25 in., 4=3.25-4.0 in., 5=>4.0 in.

<sup>5</sup>Percentage of total that are pickouts. <sup>6</sup>Merit score: 1 = outstanding; 2 = keep; 3 = marginal; 4 = drop.

Replicated trials are the average of 4 replicates. LSD indicates least significant difference ( $P = 0.05$ ).

Russets were planted 12-in. apart with 10 seed pieces per 10-ft plot, all other varieties were spaced 9-in. apart with 13 seed pieces per 10-ft plot.  
Varieties with colored flesh are indicated by 'y' for yellow.

TX = skin texture: 1 = partial russet, 2 = heavy russet, 3 = mod. russet, 4 = light russet, 5 = netted, 6 = slight net, 7 = mod. smooth, 8 = smooth, 9 = very smooth.

Sh = tuber shape: 1 = round, 2 = mostly round, 3 = round-oblong, 4 = mostly oblong, 5 = oblong-long, 6 = oblong, 7 = mostly long, 8 = long, 9 = cylindrical.

TED = tuber eye depth: 1 = very deep, 5 = medium, 9 = very shallow. TCS = tuber cross section: 1 = very flat, 5 = intermediate, 9 = very round.

<sup>2</sup>Internal Defects: HH = hollow heart, IB = internal browning. Percent of total number observed out of 12 tubers for replicate trial and 4 tubers for non replicated trial. 0 = not observed.

Table 15. Total yield, size distribution, and external characteristic for early season papa criolla (small yellow potato) variety trial in Plant Pathology Farm, Rock Springs, 2022

Variety/Line	Estimated Yield (cwt/A) <sup>1</sup>	% by size class <sup>2</sup>			Tuber Characteristics <sup>3</sup>				Notes
		Total	1	2	3	TA	C	TX	
BD1435-3	75	13	81	6	5	9	6	2	Yellow skin, yellow flesh, uniform shape
BD1339-2	82	1	95	4	4	2	8	3	Red/pink skin, yellow flesh, not uniform
BD1403-5	62	6	88	6	3	2	7	3	Nice red color, nice yellow flesh, rhizoc severe
BD910-2	75	4	78	18	6	9	7	2	yellow skin, nice yellow flesh
BD932-3	75	4	87	9	3	9	8	3	yellow skin, nice yellow flesh, lots of shapes
BD1153-7	124	1	59	40	5	9	7	3	yellow skin, nice yellow flesh, a few misshape
BD1222-1	156	3	76	21	6	9	8	3	yellow skin, yellow flesh, sprouts
BD1265-5	27	14	86	0	5	3	8	2	nice yellow flesh

<sup>1</sup>Yield Total = yield including all size categories 1, 2, and 3.

<sup>2</sup>Percentage of total yield according to size class. 1 = < 1 in., 2 = 1 - 1.625 in., 3 = > 1.625 in.

<sup>3</sup>Tuber Characteristics: TA = tuber appearance: 1 = very poor, 5=fair, 9= excellent.

C = skin color: 1 = purple, 2 = red, 3 = pink, 4 = dark brown, 5 = brown, 6 = tan, 7 = buff, 8 = white, 9 = cream.

TX = skin texture: 1 = partial russet, 2 = heavy russet, 3 = mod. russet, 4 = light russet, 5 = netted, 6 = slight net, 7 = mod. smooth, 8 = smooth, 9 = very smooth.

SH = tuber shape: 1 = round, 2 = mostly round, 3 = round-oblong, 4 = mostly oblong, 5 = oblong, 6 = mostly long, 7 = mostly long, 8 = long, 9 = cylindrical.

Planted 9-in. apart with 13 seed pieces per 10-ft plot.

Table 16. Total yield, greater than 1 7/8" yield, percent of standard, size distribution and percent pickout for SNAC Chip Trial in Pennsylvania, 2022

Variety/Line	Yield (cwt/A) <sup>1</sup>		% US#1	% of Standard <sup>2</sup>	% by size class <sup>3</sup>					% PO <sup>4</sup>
	Total	>1 7/8"			1	2	3	4	5

Table 19. Promising Varieties for Pennsylvania

## FRESH MARKET

**AF5280-5:** a fresh market variety with medium maturity from University of Maine

- In Rock Springs trials over 8 years marketable yield averaged 126% of Atlantic.
- In Southeastern Pennsylvania trials over 4 years marketable yield averaged 119% of Atlantic.
- In Erie County trials over 2 years marketable yield averaged 105% of Atlantic.

Tubers are round to oblong with slightly net skin. Low levels of pickouts; misshape and sunburn have been observed. It had average 2% hollow heart and 9% internal browning. Over 14 trials specific gravity had averaged 0.023 less than Atlantic. Has moderate scab resistance.

**AF5819-2:** a fresh market variety with medium maturity from University of Maine

- In Rock Springs trials over 4 years marketable yield averaged 132% of Atlantic.
- In Southeastern Pennsylvania trials over 2 years marketable yield averaged 115% of Atlantic.
- In Erie County trials over 3 years marketable yield averaged 132% of Atlantic.

Tubers are mostly round with slightly net skin. Low levels of pickouts; sunburn and misshapen have been observed. Over 9 trials specific gravity had average 0.014 less than Atlantic, and it had average 5% internal browning and had no hollow heart. Has moderate scab and soft rot resistance.

**BNC815-7:** a fresh market variety with medium maturity from USDA-ARS Beltsville

- In Rock Spring trials over 4 years marketable yield averaged 113% of Atlantic.

Tubers are mostly round with slightly net skin. Pickouts averaged 12%, mostly sunburn and a few growth cracks. Specific gravity averaged 0.005 less than Atlantic.

**Agate:** a fresh market variety with medium early maturity from Solanum International

- In one Rock Springs trial marketable yield was 95% of Atlantic.
- In Southeastern Pennsylvania trials over 2 years marketable yield averaged 119% of Atlantic.
- In one Erie County trial marketable yield was 129% of Atlantic.

Tubers are round to oblong with slightly net skin. Low levels of pickouts; sunburn and misshapen have been observed. Over 4 trials specific gravity averaged 0.024 less than Atlantic.

## **REDS**

**NDAF113484B-1:** a red skin variety with medium early maturity from University of Maine

- In Rock Springs trials over 6 years marketable yield averaged 85% of Chieftain.
- In Southeastern Pennsylvania trials over 3 years marketable yield averaged 111% of Chieftain.
- In Erie County trials over 3 years marketable yield averaged 67% of Chieftain.

Tubers are mostly round with smooth skin. Low levels of pickouts; sunburn have been observed. Over 12 trials specific gravity averaged 0.003 less than Chieftain. Average yields are similar to Dark Red Norland, holds its color well in storage. It has moderate scab, shatter and black spot resistance.

**A08122-9RY:** a red skin variety with yellow flesh and medium maturity from USDA-ARS Idaho

- In Rock Springs trials over 3 years marketable yield averaged 135% of Chieftain.

Tubers are round to oblong with slightly net skin. Low levels of pickouts; sunburn and secondary tubers have been observed. Specific gravity averaged 0.008 more than Chieftain.

**AF6289-2:** a red skin variety with medium early maturity from University of Maine

- In Rock Springs trials over 3 years marketable yield averaged 113% of Chieftain.
- In one Southeastern Pennsylvania trial the marketable yield was 92% of Chieftain.
- In Erie County trials over 2 years marketable yield averaged 79% of Chieftain.

Tubers are round to oblong with smooth skin. Low levels of pickouts; sunburn has been observed. Specific gravity averaged 0.003 less than Chieftain. It has moderate shatter and blackspot resistance.

## **CHIPPING**

**NY163:** a chip variety with medium maturity from Cornell University

- In Rock Springs trials over 5 years marketable yield averaged 119% of Atlantic.
- In Southeastern trials over 3 years marketable yield averaged 75% of Atlantic.
- In Erie County trials over 4 years marketable yield averaged 105% of Atlantic.

Tubers are smooth mostly round with smooth skin. Over 12 trials tubers averaged 42% in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class and 36% in the 2 $\frac{1}{2}$ " to 3 $\frac{1}{4}$ " size class. Low levels of pickouts; sunburn and gowthcracks have been observed. Specific gravity averaged 0.003 less than Atlantic. Chip color has been equal to Snowden. It has moderate scab resistance. NY163 is also being evaluated in the SNAC trials.

**MSAFB609-12:** a chip variety with medium late maturity from University of Maine

- In Rock Springs trials over 5 years marketable yield averaged 138% of Atlantic.
- In Southeastern trials over 2 years marketable yield averaged 84% of Atlantic.
- In Erie County trials over 2 years marketable yield averaged 130% of Atlantic.

Tubers are mostly round with slightly net skin. Over 8 trials tubers averaged 35% in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class and 43% in the 2 $\frac{1}{2}$ " to 3 $\frac{1}{4}$ " size class. Low levels of pickouts; sunburn and misshape have been observed. Specific gravity averaged 0.002 less than Atlantic. Chip color has been equal to Snowden. It has scab and late blight resistance. MSAFB609-12 is in the SNAC trials.

**EARLY SEASON** (from 2015 to 2022 average 91 days)

**Agate** from Solanum International

- A fresh market variety with yellow flesh, tubers are round to oblong with smooth yellow skin.
- In Rock Springs trials over 2 years marketable yield averaged 160% of Superior. Tubers averaged 52% in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class. It has no internal defects and pickouts averaged 10% growth cracks and green. Specific gravity is equal to Superior.

**NY171** from Cornell University

- A fresh market variety, tubers are round to oblong with smooth skin and purple around eyes.
- Marketable yield was 125% of Superior. 30% of the tubers were in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class and 49% in the 2 $\frac{1}{2}$ " to 3 $\frac{1}{4}$ " size class. It has no internal defects and low levels of pickouts. Specific gravity was 0.009 less than Superior. Intermediate reaction to common scab.

**BNC917-2** from USDA-ARS Beltsville

- A fresh market variety with yellow flesh. Tubers are round to oblong with smooth purple skin.
- Marketable yield was 183% of Superior. 20% of the tubers were in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class and 59% in the 2 $\frac{1}{2}$ " to 3 $\frac{1}{4}$ " size class. It has no internal defects and low levels of pickouts. Specific gravity was 0.005 less than Superior.

**NDA8512C-1R** from USDA-ARS Idaho

- Tubers are mostly round with smooth red skin.
- Marketable yield was 147% of Superior. 21% of the tubers were in the 1 $\frac{1}{8}$ " to 2 $\frac{1}{2}$ " size class and 61% in the 2 $\frac{1}{2}$ " to 3 $\frac{1}{4}$ " size class. It has no internal defects and it had low levels of pickouts. Specific gravity was 0.004 less than Superior.

**Brodie: a chipping variety that produces large tubers with oblong shape and is good choice for Pennsylvania growers.**

### Evaluation of potato cultivars and breeding lines for resistance to common scab, 2022

Thirty-eight potato cultivars and advanced breeding lines were planted in a naturally infested field at The Pennsylvania State University Russell E. Larson Agricultural Research Center in Pennsylvania Furnace, PA on 23 May. The soil type was a Hagerstown silty clay loam. The experimental design was a randomized complete block design with three replications. The plots were 4-ft long with five seed pieces planted in each plot and 5-ft breaks between plots within a row. Precipitation was 3.14, 2.26, 3.13, and 3.40 in. for Jun, Jul, Aug, and Sep, respectively. Standard crop management practices, and a recommended fungicide program for the management of early and late blights in Pennsylvania, were followed. Plants were vine killed on 15 Sep with Reglone (2.0 pt/A). Tubers were harvested on 18 Oct and were visually assessed for common scab on 27, 28 Oct. Predominant lesion type was scored for each tuber on a 0 to 3 ordinal scale: 0 = no symptom, 1 = superficial, 2 = raised, and 3 = pitted. Percent lesion coverage for each tuber was scored on a 0 to 6 ordinal scale, where 0 = no scab, 1 = > 0 – 2%, 2 = > 2 – 5%, 3 = > 5 – 10%, 4 = > 10 – 25%, 5 = > 25 – 50%, and 6 = > 50%. The ordinal data per plot were transformed to disease severity score as follows: [Σ(Percent lesion coverage × predominant lesion type × number of tubers in each category) / (18 × total number of potato tubers evaluated)] × 100. Disease incidence was expressed as the percentage of tubers with common scab symptoms in each plot. Disease data were subjected to an analysis of variance test, and means were separated using Fisher's protected least significant difference test (SAS v. 9.4, SAS Institute, Cary, NC).

Cultivars Russet Burbank and Shepody were included as a tolerant and a susceptible check for common scab, respectively. Numerically, although not statistically, Dark Red Norland, AF5819-2, NDAF113484B-1, Russet Norkotah, AF6338-6, NDAF113476CB-3, AF5762-8, Superior, AF5735-8 and MSAFB609-12 had a lower disease severity score and disease incidence than Russet Burbank and were considered as tolerant to common scab.

Cultivar/Line	Common scab severity score	Common scab incidence (%)	Cultivar/Line	Common scab severity score	Common scab incidence (%)
Dark Red Norland	1.3 j <sup>z</sup>	21.2 m	Lakeview Russet	6.5 b-j	87.8 ab

<sup>z</sup> Means followed by the same letter are not significantly different within column category at P = 0.05 as determined by Fisher's protected least significant difference test (LSD = 5.6 for severity score and 30.4 for incidence). Each value is the mean of three replicates.

### Evaluation of potato cultivars and breeding lines for resistance to late blight, 2022

Thirty-eight potato cultivars and advanced breeding lines were evaluated at The Pennsylvania State University Russell E. Larson Agricultural Research Center in Pennsylvania Furnace, PA. The soil type was a Hagerstown silty clay loam. Potatoes were planted on 10 Jun. The experimental design was a randomized complete block with three replicates. The plots were 4-ft long with five seed pieces planted in each plot and 4-ft breaks between plots within a row. Each treatment row had an adjacent row of the susceptible cv. Atlantic as a spreader row. Precipitation was 3.14, 2.26, 3.13, and 3.40 in. for Jun, Jul, Aug, and Sep, respectively. Natural late blight infection was not observed in the field. On 21 Aug, spreader rows were spray-inoculated with a mixture of four isolates of *Phytophthora infestans* clonal lineage US-23, at a concentration of  $5.8 \times 10^4$  sporangia/ml, to promote uniform spread of the pathogen to all treatment plots. Overhead sprinklers were used for approximately one hour daily when the weather was dry and hot to increase humidity in the plant canopy after infection. Disease ratings were determined by visually assessing each 4-ft plot and estimating the percentage of late blight symptomatic foliage on a 0 to 100% scale. Ratings were taken on 2, 9, 16, 23, 30 Sep. Disease data were expressed as area under the disease progress curve (AUDPC), subjected to analysis of variance, and means were separated using Fisher's protected least significant difference test (SAS v. 9.4, SAS Institute, Cary, NC).

The most susceptible plots reached 100% disease severity by the end of the season. Cultivar Kennebec was a moderately resistant check. Based on AUDPC values, AF5406-7, MSAFB609-12, AF6075-8, AF5735-8, NY165, AF5750-16, AF5707-1, AF6194-4, AF6338-6 and Lakeview Russet were significantly more resistant than cv. Kennebec.

<sup>z</sup> AUDPC = Area under the disease progress curve was calculated from 2 to 30 Sep according to the formula:  $\sum_{i=1}^n [(R_{i+1} + R_i)/2] [t_{i+1} - t_i]$ , where  $R$  = disease severity rating (% of leaf surface affected) at the  $i$ th observation,  $t_i$  = time (days) since the previous rating at the  $i$ th observation, and  $n$  = total number of observations. Each value is the mean of three replicates.

<sup>y</sup> Means followed by the same letter are not significantly different at  $P = 0.05$  as determined by ANOVA followed by Fisher's protected least significant difference test (LSD = 267).

### Evaluation of potato cultivars and breeding lines for resistance to early blight, 2022

Thirty-eight potato cultivars and advanced breeding lines were evaluated at The Pennsylvania State University Russell E. Larson Agricultural Research Center in Pennsylvania Furnace, PA. The soil type was a Hagerstown silty clay loam. Potatoes for each entry were planted on 19 May in plots arranged in a randomized complete block design with three replicates per entry. Plots consisted of a single 4-ft long row with five seed pieces planted in each plot, with a 4-ft break between plots. Each entry had an adjacent row of the susceptible cv. Dark Red Norland as a spreader row. Precipitation was 3.14, 2.26, 3.13, and 3.40 in. for Jun, Jul, Aug, and Sep, respectively. To promote uniform spread of the pathogen to all treatment plots, spreader rows were spray-inoculated with a conidial mixture of two isolates of *Alternaria solani*, at a concentration of  $1.7 \times 10^4$  conidia/ml on 18 Jul. For each plot, the percentage of symptomatic foliage was visually assessed on a 0 to 100% scale on 5, 12, 18, 25, 28 Aug. Disease data were compared by calculating the area under the disease progress curve (AUDPC), subjected to analysis of variance, and means were separated using Fisher's protected least significant difference test (SAS v. 9.4, SAS Institute, Cary, NC).

Disease pressure from early blight was high and the most susceptible plots reached 100% disease severity by the end of the season. Cultivars Kennebec and Russet Burbank were included as moderately resistant checks and Dark Red Norland was included as a susceptible check. Twelve cultivars/lines (AF5406-7, AF6338-6, Katahdin, AF5762-8, AF5071-2, Lakeview Russet, AF5521-1, AF5707-1, AF5750-16, Snowden, Shepody and AF6075-8) were characterized as moderately resistant because their AUDPC values were not significantly different from the moderately resistant check Russet Burbank and lower than the moderately resistant check Kennebec.

## **Supplemental Progress Report, 2022-----March 28, 2023**

### **Pennsylvania Regional Potato Germplasm Evaluation Program, 2022**

**Xinshun Qu and Michael Peck**

**Department of Plant Pathology & Environmental Microbiology  
The Pennsylvania State University**

The objective of this project is to find new potato varieties and advanced breeding lines that are well adapted to Pennsylvania potato growing conditions and have qualities that are suitable for processing use. We cooperate with the directors of several other potato breeding programs from the Northeast US and a few programs from outside the Northeast by evaluating their potato germplasm. Data from this project helps breeders determine which lines to consider for potential release as new varieties, thereby bringing about new potato varieties for you.

Regional trials were established in three counties across Pennsylvania: Lehigh Co., Erie Co., and the Russell E. Larson Agricultural Research Center at Rock Springs, Centre Co. Please see the Progress Report from January 2023 for details. During the winter months, tests were performed to evaluate germplasm for chip and French fry processing. Presented in this report are the chip processing results (Tables 1-4) and French fry results (Tables 5-7). The data are collected from small samples, which may not reflect all possible variations one may see within a commercial harvest.

### **Materials and Methods**

From harvest until November, tuber samples were placed in a pole barn where they were subjected to fluctuating temperatures. Storage temperatures are listed at the bottom of each table. The chipping procedure at the PSU Chip Lab was as follows. Four tubers from each breeding line/variety were peeled, cut in half, and sliced. Eight slices from the center of each half were used for chipping. Slices were fried at 365°F. The chip samples were rated on a scale of 1-10, which is in accordance with the Snack Food Color Chart. The oil used for chipping was soy-based oil (Bakers Chef heavy-duty oil). French fry tests were conducted as follows. Four tubers were peeled and cut into strips. Center strips (36 over the 4 tubers) were blanched in water for 3 minutes at 185°F then fried for 3 minutes at 365°F. The samples were rated using the USDA scale.

### **Results**

Yield results and listings of noteworthy varieties/lines were provided in the January 2023 progress report.

#### **Chipping (Tables 1-4)**

Atlantic and Snowden are the standard varieties to use for comparing the chip color of the other lines.

From out of field chipping at Rock Springs: NY165, MegaChip, Mainstee and SP327 had the best color; Atlantic, B2869-29 and Mackinaw had acceptable color.

From chipping after 3 week reconditioning: At Rock Springs, Snowden, MSAFB609-12, NY163, NC818-24, AF6522-1, AF6552-2 and NY168 had the best color; AF5933-4, MSAFB635-15, NY165, AF5973-3, AF6206-3, AF6206-5, AF6550-2, AF6555-2, AF6567-4, AF6601-2, AF6603-5, WAF16107-2, AF6543-2, BNC816-3, B3379-2, B3403-6, NC821-30, SP327, WAF16220-4, AF6618-2, AF6669-10, AF6671-10, AF6675-1, AF6684-9, AF6687-3, WAF17045-2 and NDAF14188-5 had acceptable color. At Lehigh County, NY163 and NY165 had the best color; Atlantic, Snowden, MSAFB609-12, MSAFB635-15, NY168 and SP327 had acceptable color. At Erie County, Snowden, NY165 and Y177 had the best color; NY163, NY168, MSAFB609-12, W15125-4, NC821-30 and SP327 had acceptable color.

From chipping after 6 week reconditioning: At Rock Springs, MSAFB609-12, NY163, AF6206-3, AF6522-1, AF6552-2, AF6567-4, AF6601-2, NY168 and AF6669-10 had the best color; Snowden, AF5933-4, MSAFB635-15, NY165, NC818-24, AF5973-3, AF6206-5, AF6550-2, AF6555-2, AF6603-5, WAF16107-2, AF6543-2, BNC816-3, B3379-2, W1525-4, NC821-30, SP327, WAF16220-4, AF6618-2, AF6671-10, AF6675-1, AF6684-9, AF6687-3, WAF17045-2 and NDAF14188-5 had acceptable color. At Lehigh County, MSAFB609-12 and SP327 had the best color; Atlantic, Snowden, MSAFB635-15, NY163, NY165 and NY168 had acceptable color. At Erie County, Snowden, NY163, NY165, NY168, NY177, MSAFB609-12 and NC821-30 had acceptable color.

From chipping directly from 45°F: At Rock Springs, AF6522-1 and NY168 had the best color; Snowden, AF5933-4, MSAFB609-12, NY163, NY165, NC818-24, AF6206-3, AF6206-5, AF6552-2, AF6567-4, B3403-6, SP327, WAF16220-4, AF6665-3, AF6669-10, AF6671-10, AF6675-1, AF6684-9, AF6687-3 and WAF17045-2 had acceptable color. At Lehigh County, MSAFB609-12 had the best color; Atlantic, Snowden, MSAFB635-15, NY163, NY168 and SP327 had acceptable color. At Erie County, Snowden, NY163, NY165, NY168, NY177 and MSAFB609-12 had acceptable color.

### **French fry Tests (Tables 5-7)**

At Rock Springs, Russet Burbank, AAF10596-1, AF5406-7, AF5707-1, AF5762-8, NDAF113476CB-3, AF5736-16, A11175-12TE, Bridget, Palace, SP327, AF6314-12, AF6377-10, AF6377-12, AAF14025-2, AF6749-3, AF6855-4, AAF16069-1, AAF16069-2 and COAF16277-4 had the best color. At Lehigh County, SP327, Donata and Bridget had the best color. At Erie County, Lakeview Russet, Bridget, Donata, AF5762-8 and A11175-12TE had the best color.

**The Pennsylvania Potato Research Program, the Pennsylvania Department of Agriculture and USDA funded this research in conjunction with donations. This research is the result of cooperation of growers, industry and PSU staff. The growers hosting the plots provided contributions (land, fertilizer, pesticides, time, etc.). University of Maine, Cornell University, North Carolina State University, USDA-ARS Maine, USDA-ARS Idaho, Colorado State University, Michigan State University, University of Wisconsin potato breeding programs and Solanum International, Parkland Seed, Pennsylvania Co-operative Potato Growers, Inc., Sterman Masser Inc. provided seed. Special thanks to Bob Leiby who made sure this project was completed.**
